Regressions and Figure 1

This figure and analysis requires a WRDS subscription, available here: <https://wrds-www.wharton.upenn.edu/>.

1. Download from compustat (accessible through WRDS) an annual file starting in June 1950 that includes the following variables:
 - a. SALE, EMP, AT, PPEGT, XOPR
 - b. Include the SIC code, NAICS, and gvkey for each firm
 - c. Include all firms.
 - d. Download as a csv file, and place this file in the "Compustat/" directory and name it 'compustat_data.csv'
2. Download the following series from FRED: A008RD3Q086SBEA, GDPDEF. Place in same directory. Note that these .csv files are already present in the replication files.
3. Then run 'clean_compustat_data.R' and 'fact1.R'.

Model and Figures 2-11

The code for the different versions of the model with heterogeneous firms is contained in the folder "Model – Free Entry." These files require Matlab, as well as the CompEcon Toolbox from Miranda and Fackler, available here: <https://pfackler.wordpress.ncsu.edu/compecon/154-2/>.

- In each folder that begins with "free_entry," there is a file "Start.m" that solves the model.
 - o The variable mit_flag, set in the first few lines of the file, sets which kind of dynamic exercise to run.
 - o If mit_flag = 0, only solve the steady state.
 - o If mit_flag = 1, run the entry cost shock
 - o If mit_flag = 2, run the exit shock (not in the paper)
 - o If mit_flag = 3, run the TFP shock
- Each folder corresponds to a different specification of the model:
 - o Free_entry: The baseline model in the paper
 - o Free_entry_alt_lifecycle: the exercise in appendix E
 - o Free_entry_ces: The CES model
 - o Free_entry_ces_no_adj_cost: The model with CES demand and no labor adjustment cost
 - o Free_entry_labor_cost: The baseline model where the entry cost is denoted in units of labor
 - o Free_entry_firm: The model calibrated to match facts about firms (rather than establishments)
 - o Free_entry_GJP: The model where the entry cost is as in Guiterrez, Jones and Phillippon
 - o Free_entry_sdf: The model where the stochastic discount factor varies
 - o Free_entry_target_lifecycle: The model where the adjustment cost is used to target average size at age 5

- No_entry_or_exit: the model without entry or exit
- Free_entry_labor_homo_firm: The model with no lifecycle (but heterogeneous firms)

The code for the model with symmetric equilibria is in the folder “Model – Symmetric.” These files are written as Jupyter notebooks, in python. They require the sequence-state-jacobian package, which can be downloaded here: <https://github.com/shade-econ/sequence-jacobian>.

Figure 2:

- After running “Start.m” in the folder *free_entry_frictionless*, run “plot_policy.m”

Figure 3:

- After running “Start.m” in the folder *free_entry*, run “plot_lifecycle.m”

Figures 4, 5, and 7:

- Run “Start.m” with “mit_flag = 1” in *free_entry*.
- Then run “plot_irf_entry_scaled.m” in the folder *mit_shocks_free_entry*.

Figure 6:

- Run “entry_shock.m” in *mit_shocks_free_entry/decomposition*

Figure 8

- After running “Start.m” in the folders *free_entry*, *free_entry_ces*, *free_entry_ces_no_adj_cost*, and *free_entry_frictionless*, all with mit_flag = 1, then run *compare_4_models.m* in *mit_shocks_free_entry*.

Figure 9

- After running the entry cost shock in the folders *free_entry* and *free_entry_labor_homo_firm*, then run *compare_role_of_lifecycle.m* in *mit_shocks_free_entry/*.

Figure 10

- Run the jupyter notebooks in “Model – Symmetric”
- Then run the file in “mit_shocks_free_entry” called *compare_role_of_dispersion_new.m*

Figure 11

- After running the TFP shocks (set mit_flag = 3 and run “Start.m”) in *free_entry* and *no_entry_or_exit*, then run the file *mit_shocks_free_entry/compare_tfp_shock_role_of_entry.m*.

Figure 12

The BDS data can be downloaded from here: <https://www.census.gov/data/datasets/time-series/econ/bds/bds-datasets.html>. Download the csv file “Economy-wide” and the csv file “Establishment Age.” Place those in the folder BDS/figure_12A. Also download the series POPTHM from FRED (as a csv) and place in the same folder. Note that all of these files are already present in the replication files.

Then run the file "Introduction_figures.R" in that folder. This produces figure 12A.

For the remaining panels:

- Download the FRED series PRS85006172 and 'EMRATIO'
- Then run *plot_emp_pop.R* and *plot_labor_share.R*.

Appendix figures

Figure A1 and A2

- Run *Start.m* in the folder *selection_model* with "mit_flag = 1." Then run *plot_irf_tfp_shock* in *mit_shocks_selection_model* and *plot_irf_entry_cost_shock* in *mit_shocks_selection_model*.

Figure A3

- Run *Start.m* in the folder *free_entry_firms* and then run *plot_irf_entry_scaled_firms.m* in *mit_shocks_free_entry*.

Figure A4

- Run *Start.m* in the folder *free_entry_alt_lifecycle* and then run *plot_lifecycle.m* in that same folder.

Figure A5

- The impulse response is computed by running *Start.m* in *free_entry_sdf*. It is then plotted in *mit_shocks_free_entry/plot_irf_entry_scaled_sdf.m*.

Figure A6

- The impulse response is computed by running *free_entry_target_lifecycle/Start.m*. The plot is made by running *mit_shocks_free_entry/compare_lifecycle_calibrations.m*.

Figure A7 and A8

- Run these impulse responses in *free_entry/Start.m* and *free_entry_labor_cost/Start.m* with "mit_flag = 3." Then plot in the scripts *compare_tfp_shock_role_of_entry_fixed_entry_cost.m* and *compare_tfp_shock_role_of_entry_labor_entry_cost.m* in the folder *mit_shocks_free_entry*.
